**Version** #2

---

## Task description

Create a jQuery based Instagram feed with infinite scrolling capabilities. See attached design.

Features:

- A switcher that allows switching between popular (populære) and latest (nyeste)
- Configurable hastags. By default several hashtags should be aggregated, but individual hash tags should be chooseable (see screenshot)
- It should be easy to configure hash tags

You can use a library like <http://instafeedjs.com> or similar.

## Design Requirements

See attached screenshots. You should only create content that's inside of the red boxes.

Use the latest version of Zurb Foundation for styling, also use foundation's Switch for the switch (<http://foundation.zurb.com/docs/components/switch.html>).

## Compatibility Requirements

The final code needs to work both on mobile and desktop incl. IE9. Make sure that higher-res images are loaded for retina displays.

## Implementation Requirements

You're welcome to use third-party tools and plugins. If you do so, make sure to clearly separate your code from the thirdparty code.

## Usability Requirements

The final product needs to be of high quality, with no usability flaws.

## Documentation & Code Quality

We need your code to be easily understandable. Please use inline documentation wherever needed, and write a short README file on how to work with the code.

## Hand-in

Please hand-in a simple html file with only the elements needed, using Zurb Foundation and jQuery.

We'll provide a git-repository for you to hand in to.
